Achieving Sustainable Development Goal through Digital Technology (SDG) In Africa

Achieving Sustainable Development Through Information Communication Technology (ICT) - Amb. (Dr) Jonathan Ojadah, Fciml, faiet

One of greatest challenges that countries — especially developing countries — face in realizing sustainable development is obtaining and putting in place the necessary technologies. While access to technology depends to some extent on financial resources, it is not only a financial issue.

In many instances, legal and institutional frameworks impede the development, import/export, transfer, and use of technologies for sustainable development. Quotas and tariffs can affect the ability to import technologies. Similarly, subsidies may promote the use of technologies that may waste energy, water, or other resources.

Hardware, software and other technologies are essential tool for sustainable development. They are instrumental in ensuring that people:

- have access to clean water (through water purification, efficiency, delivery, and sanitation technologies);

- have access to energy that is clean, affordable, and sustainable (e.g., through energy-efficient technologies and technologies that use alternative sources of energy);

- live in a less toxic environment (e.g., by putting in place alternative agricultural and industrial technologies that reduce the quantity and toxicity of the raw materials and processes, as well as treatment techniques);

live in a more stable environment by mitigating the effects of climate change (e.g., more energy-efficient processes and emissions control) and adapting to climate change (e.g., using GIS to assist in land use planning); and are able to effectively and efficiently manage natural resources;

have effective environmental governance regimes (e.g., in monitoring compliance and enforcement, providing public access to information, building capacity, and raising public awareness)
